

The Learning Lab at SBJA is proud to offer AIT

Dr. Berard's

Auditory Integration Training

Does your child struggle with: Poor listening/attention, poor auditory memory, misunderstanding of verbal information, overwhelmed by environmental distractions, inability to follow verbal directions, over or under sensitivity to certain sounds, poor sequencing skills, poor motor coordination or processing delays.

How does Auditory Integration Training help? Distortions in hearing perception and reduced middle ear function can be a significant contributing factor in the above conditions. These distortions can include hearing that is disorganized, erratic, asymmetrical, hypersensitive, or otherwise abnormal. Berard AIT sound training was designed to 'normalize' hearing by changing the way the brain and auditory system process information.

Postive Responses: After AIT, students may experience long-term changes in listening, speech, language, reading, spelling, writing, auditory processing, sensory integration, motor skills, self-confidence, socialization, improved sleep, and a more varied diet!

AIT has been *successfully* used to help individuals with the following:

- Auditory Processing Disorder (APD)
- Receptive & Expressive Language Impairments
- Attention Deficit /Hyperactive Disorder (AD/HD)
- Dyslexia
- Learning Disabilities (LD)
- Pervasive Developmental Disorders (PDD)
- Autism
- Depression

Too often underlying causes are left unexplored and untreated.

These difficulties can signal delayed development in **sensory integration, auditory perception and auditory processing**. This in turn interferes with the ability to accurately interpret the surrounding environment and ultimately affects a child's overall **behavior, social skills, and academic performance**.

**THE BERARD AIT
METHOD**

**An effective intervention for enhancing
foundational abilities!**
